THE PINNACLE OF STRENGTH AND STYLE

We believe that beauty should be built to last. That's why we've crafted a collection of 20mm thick tiles that combine unmatched durability with impeccable design. Whether you're looking to transform your outdoor spaces or create stunning indoor features, our 20mm thick tiles are the perfect solution.

At The Tile Theory, we understand that every space demands a different kind of resilience. That's why we offer a curated range of tile thicknesses – each engineered to meet the demands of both form and function. Whether you're designing for high-traffic commercial zones or refined residential interiors, our tiles deliver lasting performance with timeless style.

Designing outdoor spaces, if done correctly, can give an elegant uplift to your abode and make it look more spacious and stylish. Installations done after proper planning can set your outdoor space apart from the rest and make it look absolutely stunning! These tiles are immune to harsh weather conditions and have a high physical strength. We aim to provide you with a lavish and spectacular patio.

ADVICE FOR LAYING

TRADITIONAL INSTALLATION

Traditional installation is ideal for floorings that will be driven over by vehicles.

DRY INSTALLATION ON GRAVEL

Installing on gravel enables perfect drainage of rainwater.

DRY INSTALLATION ON GRASS

Installing directly on top of grass enables the creation of paths and walkways that blend in perfectly with the surroundings.

OUTDOOR RAISED LAYING SYSTEM

The raised floor system foresees the use of self-levelling, adjustable or fixed load bearing supports that easily adapt to the floor below in total safety. The system is suitable to create laying designs with variable heights from the ground, which range between 25 and 270 mm. The independence of the flooring from the supports guarantees the absorption of any structural movements. The raised system does not require a cement screed and reduces the load on the bearing structure. The open joints between the tiles allow rainwater to easily drain off, avoiding any risk of water accumulation or stagnation. The gap between the tread surface and the support surface favours ventilation and heat insulation. This solution allows for the installation of systems and piping in the gap, which can be easily inspected even once the floor has been installed.
